

## Remove accessibility errors with no source code alteration.

Standing above all others in the market, User1st's uRemediate is a world class automated accessibility remediation engine. By integrating uRemediate into your existing platform accessibility errors will be fixed by activating profiles that assist users in using your site's original content. uRemediate requires no modification to your source code which allows your developers to carefully plan future source code remediation while knowing that meanwhile, uRemediate is keeping your digital assets fully compliant with the WCAG 2.1 AA standard and Section 508 guidelines

### Is uRemediate a good fit for you?

- You don't have a fully accessible website, though you have invested in the process
- You're frustrated by the cost and effort of manual code remediation
- You need to be compliant now, but need more time to train developers, testers and management how to fix the issues at the source code level

### Why should my organization choose uRemediate?

#### Risk Mitigation

With instant automated coverage up front, your team can prioritize improvement in accessibility and universal design during a standard development process instead of having "remediation activities"

#### Simple Integration

Integration requires insertion of 5 lines of code, and has no immediate modification to the source code of digital content or applications.

#### Simple Configuration

uRemediate provides an advanced wizard-driven tool allowing non-developers to effect accessibility changes instantly

#### Low Impact

uRemediate profiles are activated by the end user when they request an accommodation. Users that do not require accommodations are not affected at all.

#### Robust Reporting

With cutting edge meta data analytics, uRemediate creates a report of each error that was resolved, which can be assigned for verification to developers and testers.

#### Enterprise Ready

uRemediate is agnostic of web framework and works with large dynamic web sites built with modern web frameworks such as SenchaJS, AngularJS, and Bootstrap. By remaining tool-agnostic we support both legacy applications and modern development allowing any site to be made accessible automatically.
